## 2. Hello world of Security Data Analysis

### KEA Kompetence SIEM and Log Analysis

Henrik Kramselund he/him han/ham hlk@zencurity.com @kramse

Slides are available as PDF, kramse@Github 

2-hello-world-security-analysis.tex in the repo security-courses

# Goals for today

Todays goals:

- A Hello World example
- Try to go from raw data into Zeek, into Elasticsearch
- Investigating a few data types along the way

Photo by Thomas Galler on Unsplash

# Plan for today

## Subjects

- Data types: IP addresses, DNS, Netflow
- Note: not all details about these types are explained today!

Exercise theme: Low level, high value

- Data types: IP addresses and reputation lists
- Zeek as an example of a powerful multi-tool

## Exercise setup

We will use a combination of your virtual servers, my switch hardware and my virtual systems.

**There will be sniffing done on traffic!  
Don't abuse information gathered**

We try to mimic what you would do in your own networks during the exercises.

Another way of running exercises might be:

<https://github.com/jonschipp/ISLET>

Recommended and used by Zeek and Suricata projects.

## Reading Summary

DDS 3. Learning the "Hello World" of Security Data Analysis

DDS 4. Performing Exploratory Security Data Analysis

Do exercises if you feel like it, notice how small valuable programs can be

## Reading Summary, continued

This chapter takes the “Hello World” concept and expands it to a walk-through of a self-contained, introductory security data analysis use case that you will be able to follow along with, execute, and take concepts from as you start to perform your own analyses. There are parallel examples in Python and R to provide a somewhat agnostic view of the similarities, strengths, and differences between both languages in a real-life data analysis context. If you’re not familiar with one or both of those languages, you should read Chapter 2 and at least skim some of the external resources referenced there.

Source: DDS 3. Learning the "Hello World"of Security Data Analysis

- Get data from HTTP – can be scheduled
- Process
- Present it - graphs and later dashboards
- We dont need to run all examples to see the benefit
- Lets try some of the scripts from this chapter

## Reading Summary, continued

This chapter focuses on exploring IP addresses by starting with further analyses on the AlienVault IP Reputation database first seen in Chapter 3.

IP addresses—along with domain names and routing concepts—are the building blocks of the Internet. They are defined in RFC 791, the “Internet Protocol / DARPA Internet Program / Protocol Specification” (<http://tools.ietf.org/html/rfc791>), which has an elegant and succinct way of describing them:

A name *indicates what we seek*. An address *indicates where it is*. A route *indicates how to get there*.

### Source DDS 4. Performing Exploratory Security Data Analysis

1. Downloading (if necessary) new data
2. Parsing/munging and converting the new data into a data frame
3. Validating the contents and structure of the new data
4. Extracting or computing relevant information from the new data source
5. Creating one or more new columns in the existing data frame
6. Running new analyses

## What happens today?

Think like a blue team member find hacker traffic

Get basic tools running

Improve situation

- See where the data end up
- What kind of data and metadata can we extract
- How can we collect and make use of it
- Databases and web interfaces, examples shown
- Consider what your deployment could be

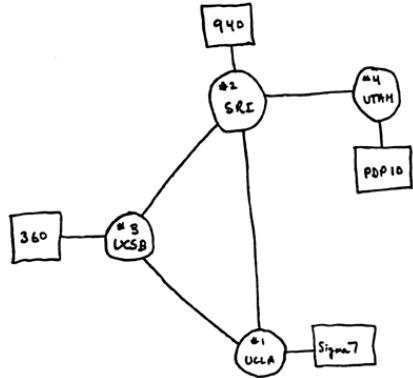

Today focus on the lower parts, but user interfaces are important too

# IP: Internet historically

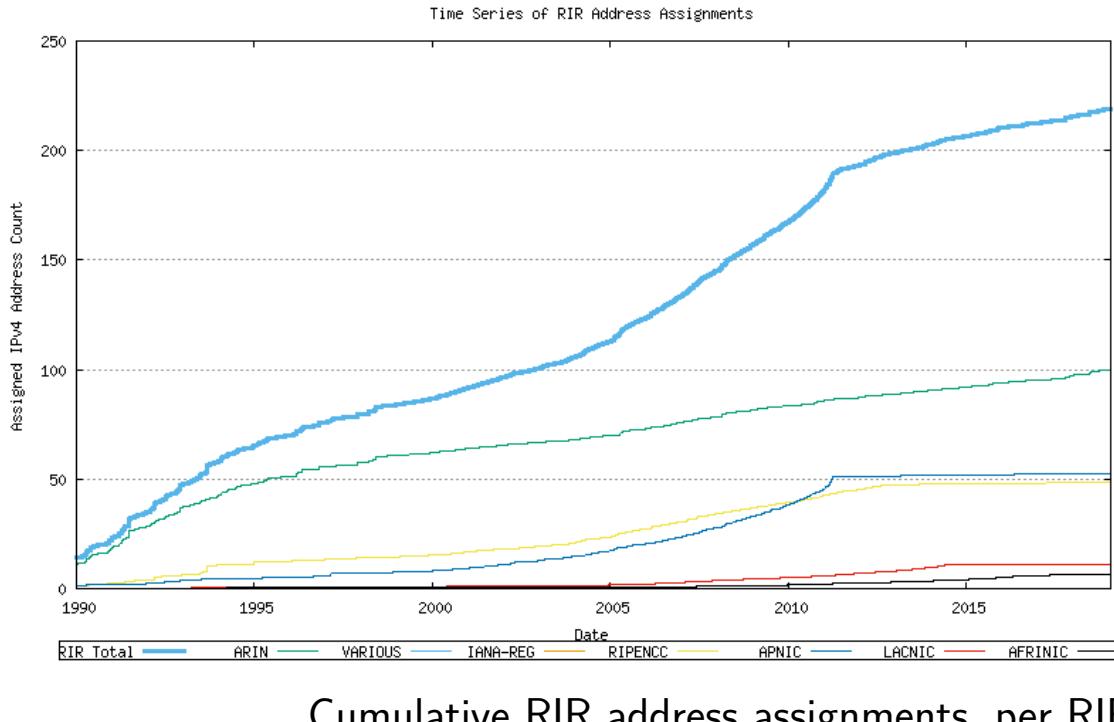

- 1961 L. Kleinrock, MIT packet-switching teori
- 1962 J. C. R. Licklider, MIT - notes
- 1964 Paul Baran: On Distributed Communications
- 1969 ARPANET start 4 nodes
- 1971 14 nodes
- 1973 Work on Internet Protocols IP started
- 1973 Email is about 75% af ARPANET traffik
- 1974 TCP/IP: Cerf/Kahn: A protocol for Packet Network Interconnection
- 1983 EUUG → DKUUG/DIKU connection
- 1988 ca. 60.000 systemer på Internet The Morris Worm rammer ca. 10%
- 2002 Ialt ca. 130 millioner på Internet

# Internet historically set - anno 1969

- Node 1: University of California Los Angeles
- Node 2: Stanford Research Institute
- Node 3: University of California Santa Barbara
- Node 4: University of Utah

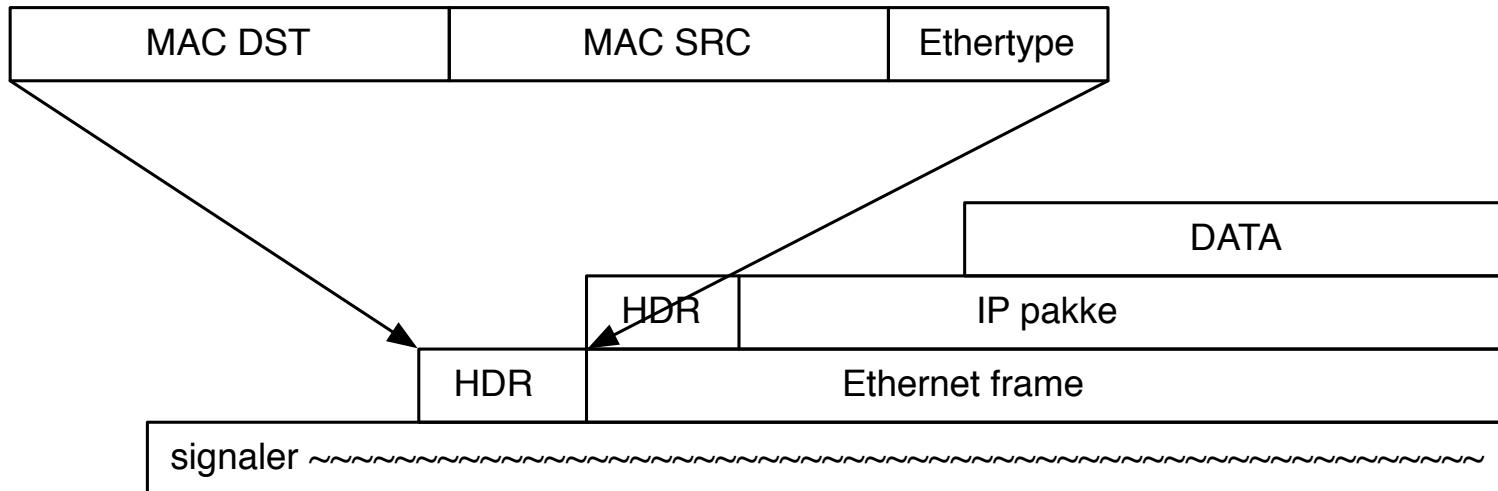

# What are Internet hosts

Source: IPv4 Address Report - 28-Jan-2019 <http://www.potaroo.net/tools/ipv4/>

## Packets across the wire or wireless

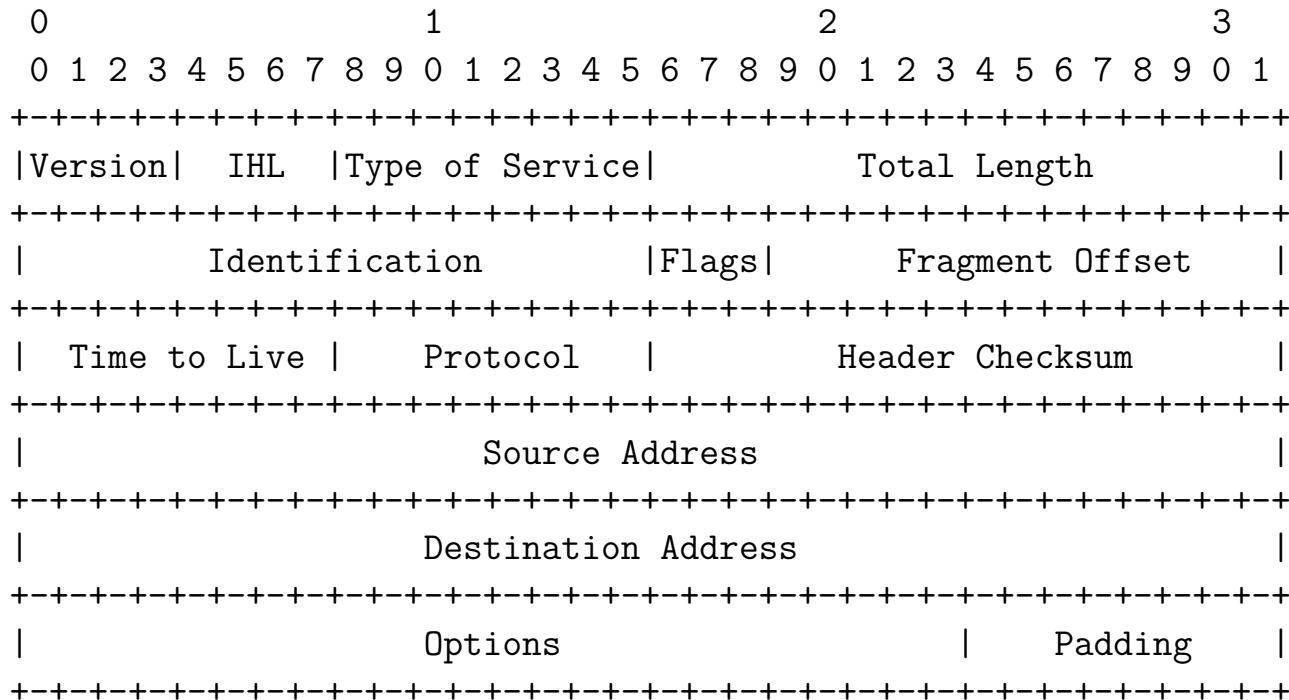

Looking at data as a stream the packets are a pattern laid on top

Network technology defines the start and end of a frame, example Ethernet

From a lower level we receive a packet, example 1500-bytes from Ethernet driver

Operating system masks a lot of complexity

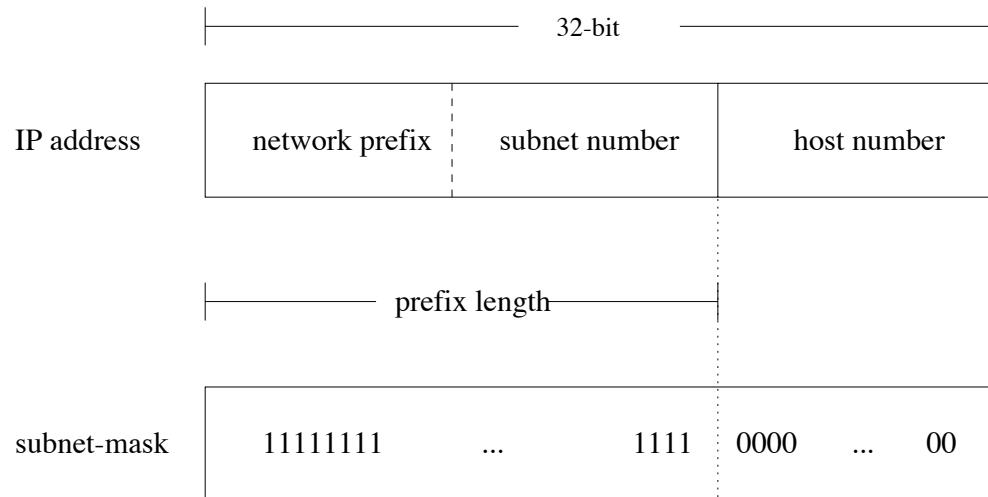

# IPv4 packets - header - RFC-791

Example Internet Datagram Header

# Common Address Space

Internet is defined by the address space, one  
Based on 32-bit addresses, example 10.0.0.1

## IPv4 address

```
hlk@bigfoot:hlk$ ipconvert.pl 127.0.0.1
Adressen er: 127.0.0.1
Adressen er: 2130706433
hlk@bigfoot:hlk$ ping 2130706433
PING 2130706433 (127.0.0.1): 56 data bytes
64 bytes from 127.0.0.1: icmp_seq=0 ttl=64 time=0.135 ms
64 bytes from 127.0.0.1: icmp_seq=1 ttl=64 time=0.144 ms
```

IP-adresser typically written as decimal numbers with dots

**dot notation:** 10.1.2.3

## IP-adresser as bits

IP-adresse: 127.0.0.1

Heltal: 2130706433

Binary: 11111110000000000000000000000001

IP-address converted to bits

Computers use bits

Previously we used classes: A, B, C, D og E

This proved to be a bit inflexible:

- A-klasse has 16 million hosts
- B-klasse about 65.000 hosts
- C-klasse only 250 hosts

Most people asked for B-klasser - starting to run out!

D-klasse used for multicast

E-klasse reserved

See [http://en.wikipedia.org/wiki/Classful\\_network](http://en.wikipedia.org/wiki/Classful_network)

**Stop saying C, say /24**

# CIDR Classless Inter-Domain Routing

Classful routing		Classless routing CIDR	
4 class C networks	Inherent subnet mask	Supernet	Subnet mask
192.0.8.0	255.255.255.0	192.0.8.0	255.255.252.0
192.0.9.0	255.255.255.0		252d=11111100b
192.0.10.0	255.255.255.0		
192.0.11.0	255.255.255.0	Base network/prefix	
			192.10.8.0/22

Subnet mask originally inferred by the class

Started to allocate multiple C-class networks - save remaining B-class

Resulted in routing table explosion

A subnet mask today is a row of 1-bit

10.0.0.0/24 means the network 10.0.0.0 with subnet mask 255.255.255.0

Supernet, supernetting

# RFC-1918 Private Networks

Der findes et antal adresserum som alle må benytte frit:

- 10.0.0.0 - 10.255.255.255 (10/8 prefix)
- 172.16.0.0 - 172.31.255.255 (172.16/12 prefix)
- 192.168.0.0 - 192.168.255.255 (192.168/16 prefix)

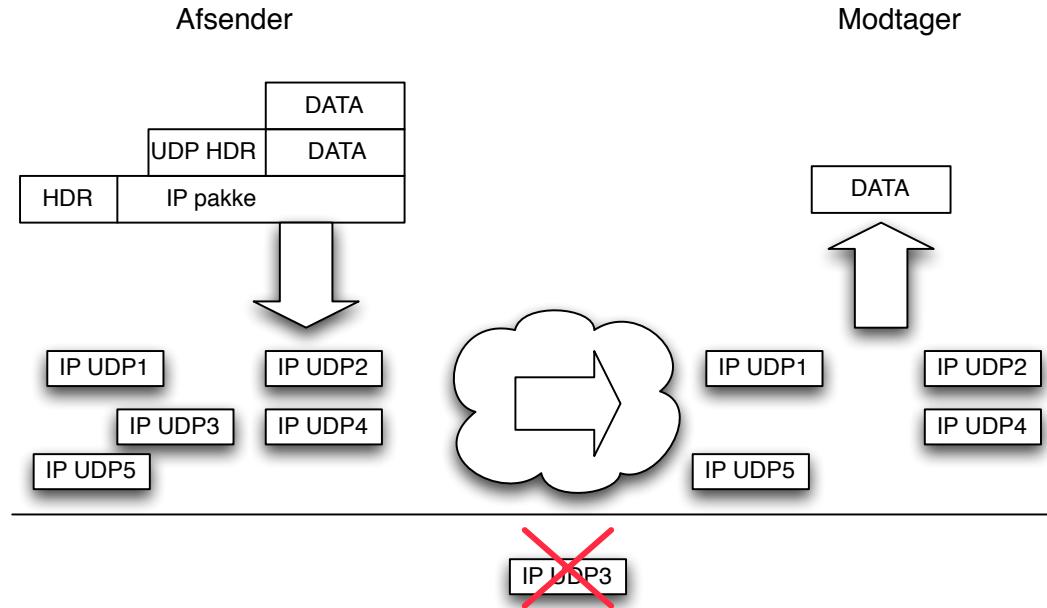

Address Allocation for Private Internets RFC-1918 adresserne!

NB: man må ikke sende pakker ud på internet med disse som afsender, giver ikke mening

The blocks 192.0.2.0/24 (TEST-NET-1) , 198.51.100.0/24 (TEST-NET-2) ,  
and 203.0.113.0/24 (TEST-NET-3) are provided for use in  
documentation.

169.254.0.0/16 has been ear-marked as the IP range to use for end node  
auto-configuration when a DHCP server may not be found

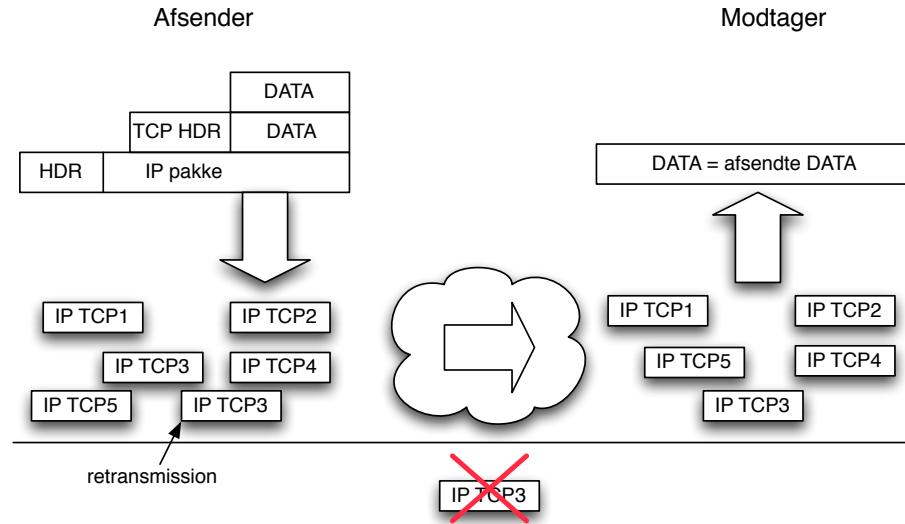

# UDP User Datagram Protocol

Connection-less RFC-768, *connection-less*

Used for Domain Name Service (DNS)

# TCP Transmission Control Protocol

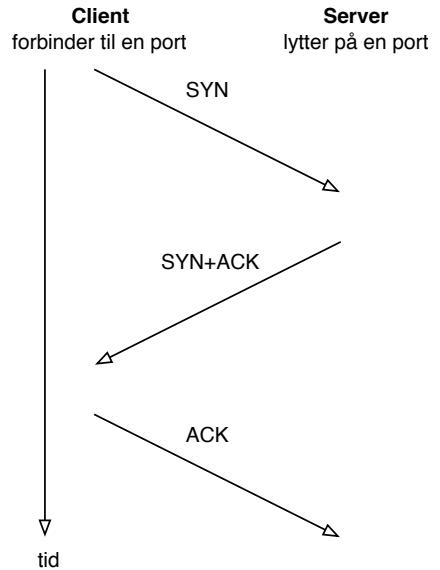

Connection oriented RFC-791 September 1981, *connection-oriented*

Either data delivered in correct order, no data missing, checksum or an error is reported

Used for HTTP and others

# TCP three way handshake

- Session setup is used in some protocols
- Other protocols like HTTP/2 can perform request in the first packet

## Well-known port numbers

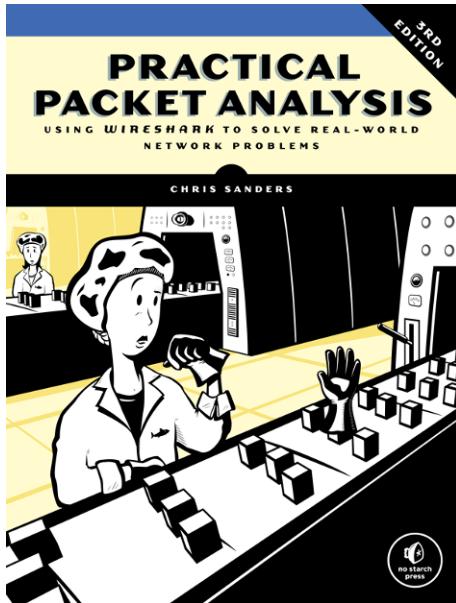

IANA maintains a list of magical numbers in TCP/IP  
Lists of protocol numbers, port numbers etc.

A few notable examples:

- Port 25/tcp Simple Mail Transfer Protocol (SMTP)
- Port 53/udp and 53/tcp Domain Name System (DNS)
- Port 80/tcp Hyper Text Transfer Protocol (HTTP)
- Port 443/tcp HTTP over TLS/SSL (HTTPS)

# Book: Practical Packet Analysis (PPA)

*Practical Packet Analysis, Using Wireshark to Solve Real-World Network Problems* by Chris Sanders, 3rd Edition April 2017, 368 pp. ISBN-13: 978-1-59327-802-1

<https://nostarch.com/packetanalysis3>

# Investigate examples from the internet

## Simple Example

Let's begin with an example. Assume we want to create a simple `ping` measurement from 50 probes anywhere in the world to `ripe.net`.

Here's how to do this in cURL:

```
Terminal
$ curl -H "Content-Type: application/json" -H "Accept: application/json" -X POST -d '{
  "definitions": [ { "target": "ripe.net", "description": "My First Measurement",
    "type": "ping", "af": 4 } ],
  "probes": [ { "requested": 50, "type": "area", "value": "WW" } ] }' https://atlas.ripe.net/api/v1/measurement/?key=YOUR_API_KEY
```

- Which web services do you use? Can we find examples of XML and JSON web services
- Look into the services provided by DBC, what languages, formats, services - look at their Github account DBCDK
- We will use internet data from RIPE NCC Atlas service, if nothing else:  
<https://ripe-atlas-tools.readthedocs.io/en/latest/>  
[https://atlas.ripe.net/docs/api/v2/manual/pdf/ripe\\_atlas\\_api\\_V2\\_manual.pdf](https://atlas.ripe.net/docs/api/v2/manual/pdf/ripe_atlas_api_V2_manual.pdf)
- If using the command line to set the API key: `ripe-atlas configure --set authorisation.create=e7fd3981-9592-481e-8bcd-f50d17e65de8`

# DNS root servers

As of 2019-01-29, the root server system consists of 933 instances operated by the 12 independent root server operators.

<http://root-servers.org/>

# DNS is important

## Using PacketQ

Let's have a practical look at how PacketQ works by trying to figure out what kind of DNS ANY queries are being sent towards our name-server.

DNS ANY traffic is currently commonly abused for DNS amplification attacks (See Blog post "[DDoS-Angriffe durch Reflektierende DNS-Amplifikation vermeiden](#)" in German). The first thing I want to know is what are the IP addresses of the victims of this potential DNS amplification attack:

```
packetq -t -s "select src_addr,count(*) as count from dns where qtype=255 group by src_addr order by count desc limit 3" lololo.20130118.070000.000179
"src_addr" , "count"
"216.245.221.243" , 933825
"85.126.233.70" , 16802
"80.74.130.55" , 91
```

Another tool that provides a basic SQL-frontend to PCAP-files

<https://www.dns-oarc.net/tools/packetq>

<https://github.com/DNS-OARC/PacketQ>

Going back in time and finding systems that visited a specific domain can explain when and where an infection started.

## Other tools and references

Deciding on which tool to use, Zeek or PacketQ depends on the situation.

Other tools and references:

- Packetbeat <https://www.elastic.co/products/beats/packetbeat>
- <http://securityblog.switch.ch/2013/01/22/using-packetq/>
- <http://jpmens.net/2013/05/27/server-agnostic-logging-of-dns-queries-responses/>

# Indicators of Compromise and Signatures

An IOC is any piece of information that can be used to objectively describe a network intrusion, expressed in a platform-independent manner. This could include a simple indicator such as the IP address of a command and control (C2) server or a complex set of behaviors that indicate that a mail server is being used as a malicious SMTP relay.

When an IOC is taken and used in a platform-specific language or format, such as a Snort Rule or a Zeek-formatted file, it becomes part of a signature. A signature can contain one or more IOCs.

Source: Applied Network Security Monitoring Collection, Detection, and Analysis, 2014 Chris Sanders

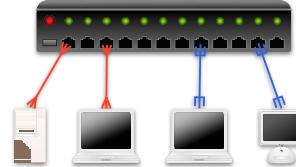

## Reading Summary, False Positives

- True Positive (TP). An alert that has correctly identified a specific activity. If a signature was designed to detect a certain type of malware, and an alert is generated when that malware is launched on a system, this would be a true positive, which is what we strive for with every deployed signature. *Indicators of Compromise and Signatures*
- False Positive (FP). An alert has incorrectly identified a specific activity. If a signature was designed to detect a specific type of malware, and an alert is generated for an instance in which that malware was not present, this would be a false positive.
- True Negative (TN). An alert has correctly not been generated when a specific activity has not occurred. If a signature was designed to detect a certain type of malware, and no alert is generated without that malware being launched, then this is a true negative, which is also desirable. This is difficult, if not impossible, to quantify in terms of NSM detection.
- False Negative (FN). An alert has incorrectly not been generated when a specific activity has occurred.

Source: Applied Network Security Monitoring Collection, Detection, and Analysis, 2014 Chris Sanders

# Reputation-Based Detection

- The most basic form of intrusion detection is reputation-based detection
- Similar concept to block lists for SMTP spam relays
- I often recommend <https://github.com/stamparm/maltrail> as a source of lists
- Other sources are lists like RIPE NCC delegated, which IP prefixes are handed out in different countries  
<https://ftp.ripe.net/pub/stats/ripencc/delegated-ripencc-extended-latest>  
ripencc|DK|ipv4|185.129.60.0|1024|20151130|allocated|
- Tool often mentioned are Argus and SiLK <https://tools.netsa.cert.org/silk/>  
If we end up having time today, or another day, we should look into this tool chain also!
- Old and mature tools have been proven to work

## IP reputation

Zeek documentation Intel framework

<https://docs.zeek.org/en/stable/frameworks/intel.html>

Suricata reputation support

<https://suricata.readthedocs.io/en/latest/reputation/index.html>

# Exercise

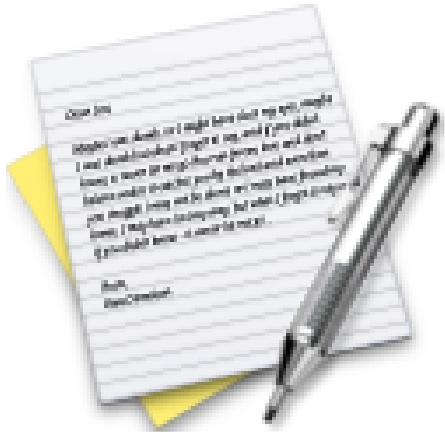

Now lets do the exercise

## Data types: IP addresses – 15min

which is number **15** in the exercise PDF.

# Exercise

Now lets do the exercise

## Data types: IP reputation – 15min

which is number **16** in the exercise PDF.

## Low level, high value

- I will introduce some of my favourite tools, and they are low-level

# Netflow

- Netflow is getting more important, more data share the same links
- Accounting is important
- Detecting DoS/DDoS and problems is essential
- Netflow sampling is vital information - 123Mbit, but what kind of traffic
- NFSen is an old but free application <http://nfsen.sourceforge.net/>
- Currently also investigating sFlow - hopefully more fine grained
- sFlow, short for "sampled flow", is an industry standard for packet export at Layer 2 of the OSI model, <https://en.wikipedia.org/wiki/SFlow>

Netflow is often from routers, we dont have any here

Also look into Elastiflow! <https://github.com/robcowart/elastiflow>

# Collect Network Evidence from the network

## Network Flows

Cisco standard NetFlow version 5 defines a flow as a unidirectional sequence of packets that all share the following 7 values:

- Ingress interface (SNMP ifIndex)
- IP protocol, Source IP address and Destination IP address
- Source port for UDP or TCP, 0 for other protocols
- Destination port for UDP or TCP, type and code for ICMP, or 0 for other protocols
- IP Type of Service

today Netflow version 9 or IPFIX

Source:

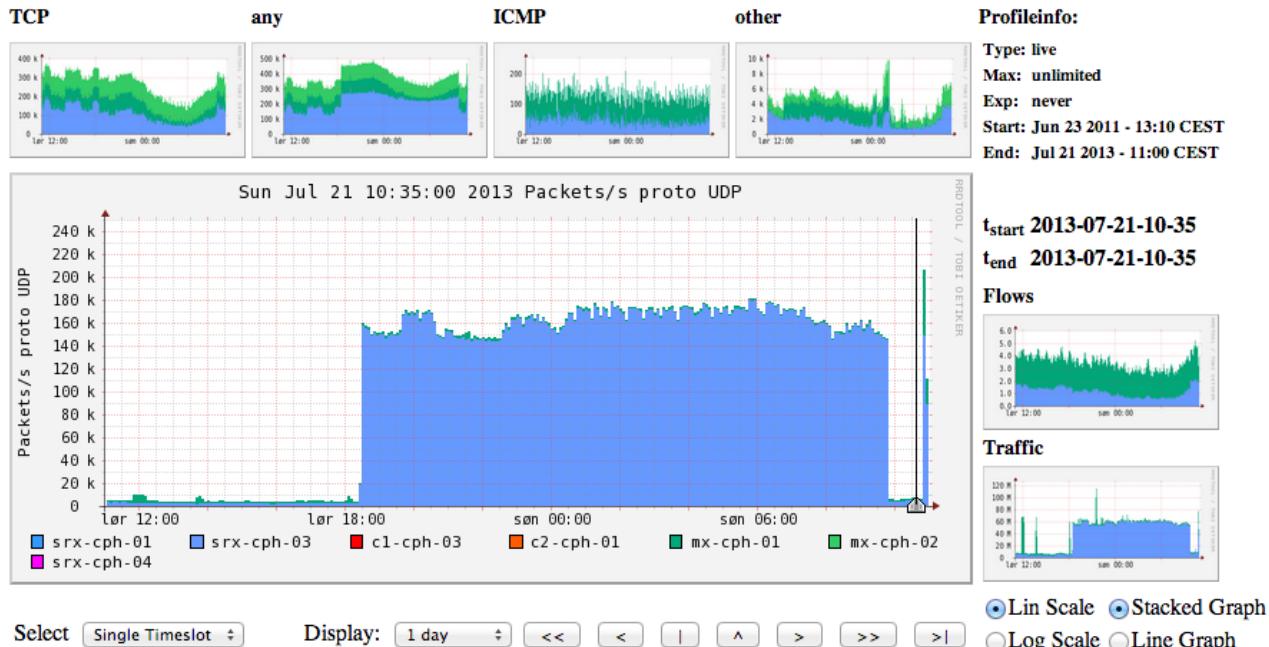

<https://en.wikipedia.org/wiki/NetFlow>

[https://en.wikipedia.org/wiki/IP\\_Flow\\_Information\\_Export](https://en.wikipedia.org/wiki/IP_Flow_Information_Export)

# Netflow NFSen

## Profile: live

An extra 100k packets per second from this netflow source (source is a router)

# Netflow processing from the web interface

NFSEN - Profile live May 31 2007 - 04:40

Bringing the power of the command line forward

# The Zeek Network Security Monitor

## The Zeek Network Security Monitor

**Why Choose Zeek?** Zeek is a powerful network analysis framework that is much different from the typical IDS you may know.

### Adaptable

Zeek's domain-specific scripting language enables site-specific monitoring policies.

### Efficient

Zeek targets high-performance networks and is used operationally at a variety of large sites.

### Flexible

Zeek is not restricted to any particular detection approach and does not rely on traditional signatures.

### Forensics

Zeek comprehensively logs what it sees and provides a high-level archive of a network's activity.

### In-depth Analysis

Zeek comes with analyzers for many protocols, enabling high-level semantic analysis at the application layer.

### Highly Stateful

Zeek keeps extensive application-layer state about the network it monitors.

### Open Interfaces

Zeek interfaces with other applications for real-time exchange of information.

### Open Source

Zeek comes with a BSD license, allowing for free use with virtually no restrictions.

The Zeek Network Security Monitor is not a single tool, more of a powerful network analysis framework. Note: the project was renamed from Bro to Zeek in Oct 2018

Source <https://www.zeek.org/>

# Zeek scripts

```
global dns_A_reply_count=0;
global dns_AAAA_reply_count=0;
...
event dns_A_reply(c: connection, msg: dns_msg, ans: dns_answer, a: addr)
{
    ++dns_A_reply_count;
}

event dns_AAAA_reply(c: connection, msg: dns_msg, ans: dns_answer, a: addr)
{
    ++dns_AAAA_reply_count;
}
```

source: dns-fire-count.bro from

<https://github.com/LiamRandall/bro-scripts/tree/master/fire-scripts>

<https://www.zeek.org/sphinx-git/script-reference/scripts.html>

# Exercise

Now lets do the exercise

## Zeek on the web 10min

which is number **17** in the exercise PDF.

# Get Started with Zeek

- To run in “base” mode:

```
zeek -r traffic.pcap
```

- To run in a “near zeekctl” mode:

```
zeek -r traffic.pcap local
```

- To add extra scripts:

```
zeek -r traffic.pcap myscript.zeek
```

## Zeek demo: Run

```
// Use the deploy command to initialize and start zeek first
```

```
debian:~ root# zeekctl
```

```
Welcome to ZeekControl 1.5
```

```
Type "help" for help.
```

```
[ZeekControl] > install
creating policy directories ...
installing site policies ...
generating standalone-layout.zeek ...
generating local-networks.zeek ...
generating zeekctl-config.zeek ...
generating zeekctl-config.sh ...
...
debian:etc root# grep eth0 node.cfg
interface=eth0
```

Our Zeek node.cfg is in /opt/zeek/etc

## Zeek demo: Run Zeek

```
[ZeekControl] > start
... starting zeek
// Exit using ctrl-d and then look at logs
debian:zeek root# cd /opt/zeek/logs/current
debian:zeek root# pwd
/opt/zeek/logs/current
debian:current root# tail -f dns.log
```

More examples at:

<https://www.zeek.org/sphinx/script-reference/log-files.html>

# Suricata IDS/IPS/NSM

Suricata is a high performance Network IDS, IPS and Network Security Monitoring engine. Open Source and owned by a community run non-profit foundation, the Open Information Security Foundation (OISF). Suricata is developed by the OISF and its supporting vendors.

<http://suricata-ids.org/> <http://openinfosecfoundation.org>

I often use Suricata and Zeek together

## Commercial Support

You can and should use updated rulesets for Suricata.

I Recommend the Emerging Threats ET Pro ruleset, which is about USD 900 per year per sensor. So two sites with Suricata running in both, 2x USD 900

# Exercise

Now lets do the exercise

## Zeek on the web 10min

which is number **17** in the exercise PDF.

# Exercise

Now lets do the exercise

## Zeek DNS capturing domain names – 15min

which is number **18** in the exercise PDF.

# Exercise

Now lets do the exercise

## Zeek TLS capturing certificates – 15min

which is number **19** in the exercise PDF.

## Zeek and Elasticsearch, Filebeat to the rescue

- Lets try to get data from Zeek into Elasticsearch
- Can Zeek produce something nice
- Can Elasticsearch parse something nice
- I think JSON is nice.
- Lucky us: 06 AUGUST 2020 ENGINEERING *Collecting and analyzing Zeek data with Elastic Security* by Michael Young  
<https://www.elastic.co/blog/collecting-and-analyzing-zeek-data-with-elastic-security>
- PS it talks about GeolP enrichment too!

## Zeek packages

```
zkg install
```

- Zeek can be expanded and a lot of packages exist
- <https://packages.zeek.org/> 153 packages!
- Lets look at some example scripts like some from CVEs

## More Exercises?

We probably ran out of time, but I wanted to show  
<https://github.com/crits/crits/wiki> which has a large list of CRITs objects

# Security Onion

Security Onion is a Linux distro for IDS (Intrusion Detection) and NSM (Network Security Monitoring).  
<http://securityonion.net>

Nice starting point for researching dashboards/network packets

## For Next Time

Think about the subjects from this time, write down questions

Check the plan for chapters to read in the books

Visit web sites and download papers if needed

Retry the exercises to get more confident using the tools
